LNG is natural gas that is super cooled to negative 260 degrees Fahrenheit. By super cooling the natural gas, we reduce its volume to 1/600th of the original size. For example, if we had 600,000 cubic feet of natural gas and super cool it, we'll end up with 1,000 cubic feet of LNG.

The Gas/Liquid Separation occurs in the Vessel, while the Liquid is stored in the parking loop shaped fingers. A basic slug catcher design contains the buffer volume for gas and liquid. A control system is used for controlled outflow of gas and liquid to the downstream processing facilities.
